Title: Senior Community Living

Term: Spring 2021

Department: Architecture

Abstract: A continuum of long-term care services that include a combination of housing, health care and personal care services. Combining Independent living facilities for people who do not need specialized medical care or daily living assistance and Assisted living facilities are for those who don't need extensive care as provided by nursing care facilities but need some assistance with daily activities. The idea behind senior living community is to provide as much autonomy and independence as possible in a residential environment. But it also provides for any supportive care services that are needed such as help with housekeeping, cooking, and medication management. The project, will consist of an Y-shaped structure with three tall wings radiating from the center of the first story base that is a square in plan. Plans call for a mix of independent living, in addition to ancillary features such as a beauty salon, a market, a multi-purpose room, a gym, a library, and a swimming pool. In order to keep costs low for residents and offer affordable options, residents can pitch in with operational tasks, whether answering the phones, helping at community spaces, giving classes or assisting with other essential tasks.

Keywords: Sustainable Architecture, independent living facilities, Residential environment
